

OUR GREEN COMMITMENT

At TAG, we recognise our role as a responsible corporate citizen in protecting our planet for future generations. As business aviation continues to grow, sustainability efforts are increasingly necessary to meet industry and global climate goals.

Below are the main initiatives which TAG have implemented.

SUSTAINABLE AVIATION FUEL (SAF)

SAF is a blend of conventional jet fuel with non-conventional fuel derived from alternative sources such as household waste and cooking oil. The blend of the fuel enables a reduction in the net greenhouse gas emissions. Ultimately, its uptake will reduce the levels of conventional jet fuel production and help towards a more sustainable way of flying. It works in exactly the same way as regular jet fuel and is designed to be 'dropped in' along with normal jet fuel. TAG Aviation offers SAF at multiple airports globally.

CARBON OFFSETTING

TAG Aviation Europe is able to offer a carbon offsetting programme for charter flights via Thrust Carbon. As the leading carbon intelligence platform in travel, they report, reduce, and remove emissions. Their IATA & BTN award-winning products are easy to integrate and they only work with verified carbon offsetting projects. These are stringently validated, registered, and regularly verified by third-party auditors to internationally recognised standards, such as Verified Carbon Standard (VCS). Our charter clients are automatically opted into the carbon emissions programme so they are easily empowered to be more sustainable.

TAG Aviation is also a participant of the CORSIA (Carbon Offsetting and Reduction Scheme for International Aviation) program. This program is designed to lower and control carbon emissions in the international aviation field, in the hope of reducing aviation's impact on climate change.

GREEN INITIATIVES

TAG is enhancing its green credentials **on the ground** as well as the air in many ways. One of these is a collaboration with **Go Zero Travel**, a corporate chauffeur service operating electric cars

throughout London and the home counties. This relationship allows completely green ground travel for environmentally focused passengers travelling in and out of London airports.

In the TAG **offices** worldwide, we encourage **waste reduction** by always having recycling bins and adopting a "double sided" printing policy as well as digital solutions to actively reduce the use of paper - plus, we only use recycled paper. We also limit consumption of disposable plastic, promoting a "reuse" ethos by offering our staff bamboo drinking flasks, double insulated glass mugs and reusable plastic bottles.

In Europe, we partner with **Lyreco** for workplace supplies. In 2004, Lyreco was the first company in the Office Supplies Industry to join the UN Global Compact Initiative, committing to integrating environmental principles into its strategy, policies and procedures, demonstrating the company's long term commitment to sustainability.

Lyreco ensures ethics and compliance in their supply chain. They provide sustainable alternatives for all product ranges, focus on reducing packaging and are currently developing low emission delivery solutions.

At our Farnborough office we also offer our staff the opportunity to be part of a **Sustainable Travel Scheme**. With incentives given every day when a form of sustainable travel is used to get to and from work.

EDUCATION

We believe that the best way forward in our sustainability efforts is to continue to learn and create awareness. We offer all our colleagues access to RAVEN's online course - 'Aviation's Sustainable Future: Building Your Vision' which provides knowledge on how the aviation industry can play a role in mitigating local, regional and international environmental challenges.
